

Experiential Learning
Project Assessment-I
on
“Personal Expense Tracker”
under the course
Python Programming Language (N-PCCCM304P)

Presented By: Purva Sachin Kale

Under the Guidance of: Mrs. Mayuri Getme

Session: 2026–27 (ODD)

Department of CSE (AI & ML)

Contents

- Problem statement
- Objectives
- Algorithm
- Flowchart / pseudocode
- Understanding of Python logic
- GitHub account and repository creation
- Uploading code and meaningful commits
- Collaboration and individual contribution

Problem Statement

Managing personal income and expenses manually can be difficult and time-consuming. Users may forget daily expenses or find it difficult to understand where their money is being spent.

The Personal Expense Tracker is a Python-based application designed to help users record and manage their daily income and expenses.

The application allows users to add, view, update and delete transactions, organize expenses into categories, calculate total income, total expenses and available balance, and generate monthly and category-wise reports.

The system stores financial records so that users can review and manage their personal financial information in an organized way.

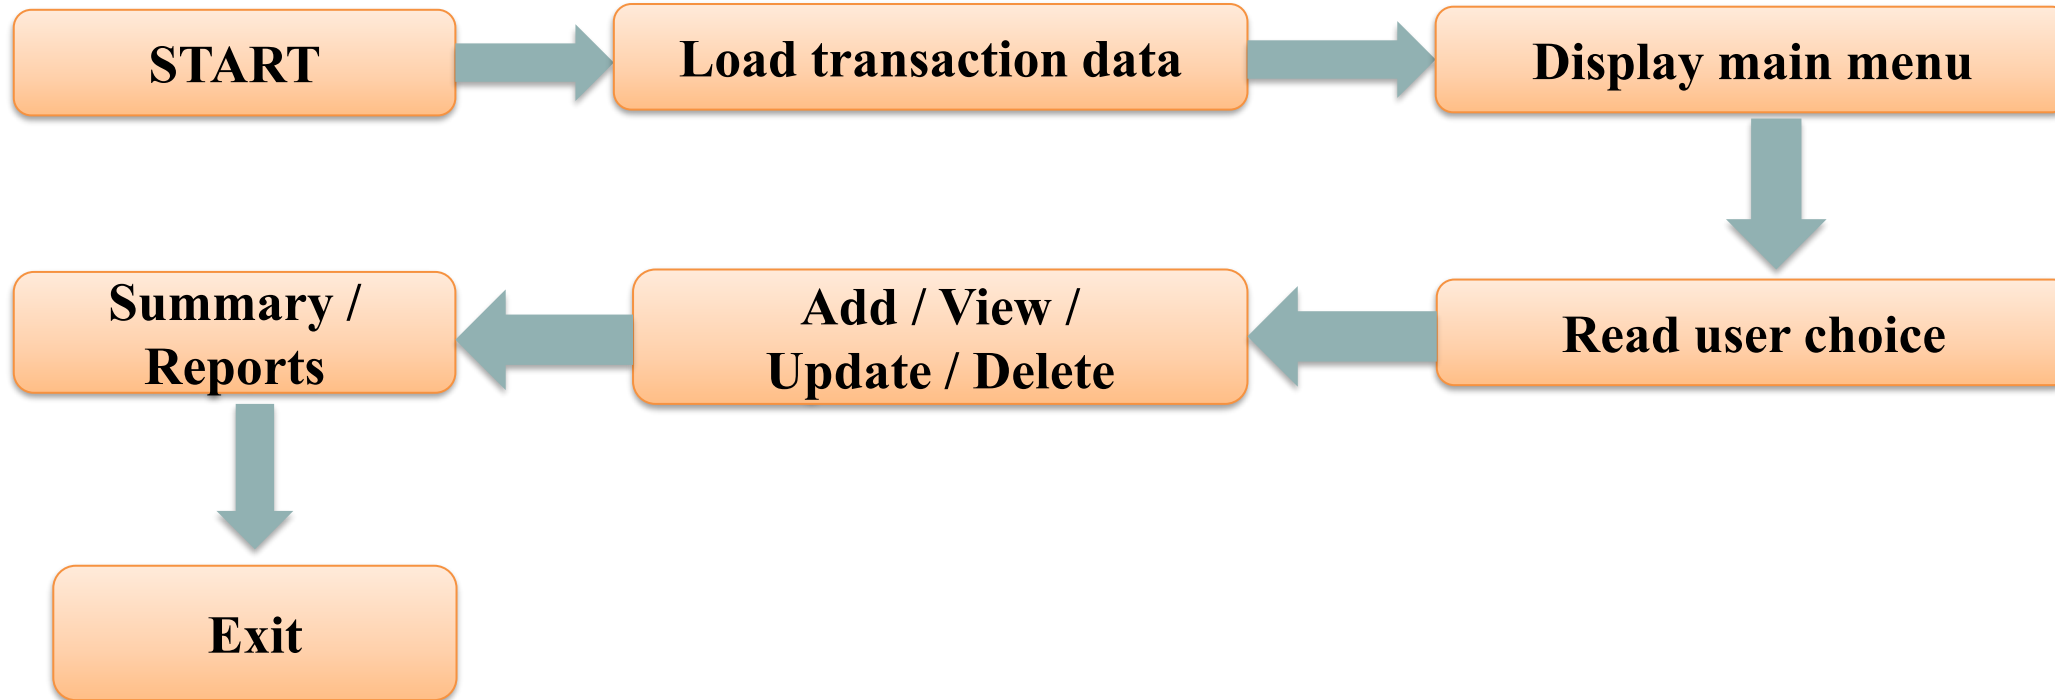

Objectives

- Record daily income and expenses.
- Organize transactions into different categories.
- Add, view, update and delete transactions.
- Calculate total income and total expenses.
- Calculate the available balance.
- Generate category-wise expense reports.
- Generate monthly financial reports.
- Store transaction records for future use.
- Provide a simple menu-driven interface.

Algorithm

- Start the program and load previously saved transaction records.
- Display the main menu and accept the user's choice.
- For Add Transaction, enter type, amount, category, date and description, then save the record.
- For View, Update or Delete, retrieve the selected transaction and perform the requested operation.
- For Summary, calculate total income, total expenses and balance.
- For reports, calculate category-wise and monthly income/expense information.
- Save updated data and return to the main menu.
- Repeat until the user selects Exit, then stop the program.

Flowchart / Pseudocode

Pseudocode: WHILE True → display menu → read choice → perform selected operation → save data → return to menu → if choice is Exit, BREAK.

Understanding of Python Logic

- Variables store amount, transaction type, category, date and description.
- Lists and dictionaries maintain multiple transaction records and their details.
- Functions divide the application into tasks such as add, view, update, delete and report generation.
- Conditional statements (if, elif, else) handle menu choices and validation.
- A while loop keeps the menu running until Exit is selected.
- File handling / database stores transaction records for future use.
- datetime records and processes transaction dates for monthly reports.
- try/except can handle invalid input and file-related errors.

GitHub Account & Repository

GitHub account: purvakml25-beep

Repository: Personal-Expense-Tracker

Visibility: Public

README.md contains the project description, objectives, working logic, technologies and running instructions.

Main Python file: main.py

The repository is used to maintain project files, track changes and demonstrate development progress.

Code Uploading, Commits & Contribution

- Create the repository and add README.md.
- Upload the Python source code and required data/storage file.
- Use meaningful commits to describe each development stage.
- Example commits: Initial repository setup; Updated README; Added transaction management; Added financial summary; Added reports; Fixed input validation.
- Collaboration: GitHub can be used for sharing the repository and reviewing changes if multiple contributors are involved.
- Individual contribution: I created and maintained the repository, developed the Python program, implemented the required features, tested the application and maintained the documentation and commit history.

Project Status & Running

- The project is under development and features will be implemented and tested progressively.
- Install Python on the computer.
- Download or clone the repository.
- Open the project folder in a Python-supported editor such as VS Code.
- Run the main Python program.
- Test adding, viewing, updating and deleting transactions.
- Test balance calculation and category-wise / monthly reports.

Thank You
